APPLICATION

PARENT CASE DATA:

This application is a Continuation-in-Part of applications Ser. Nos. 10/721,693 and 10/852,997, respectively filed on Nov. 25, 2003 and May 25, 2004, which Applications claims priority to Provisional Applications Serial Nos. 60/429,387 and 60/444,614, respectively filed on Nov. 26, 2002 and Feb. 3, 2003, each of which applications are herein incorporated by reference in their respective entirety.

NUMBER OF CLAIMS: 106 4 Figure(s).

DESCRIPTION OF FIGURES:

FIG. 1 is a diagrammatic illustration of a system for delivering a composition comprising a therapeutic agent according to an embodiment of the present invention.

FIG. 2 is a diagrammatic illustration of a catheter implanted in a patient according to an embodiment of the present invention.

FIG. 3 is a diagrammatic illustration of a catheter implanted in a patient according to an embodiment of the present invention.

FIG. 4 is a diagrammatic illustration of a system for delivering a composition comprising a therapeutic agent according to an embodiment of the present invention.

NUMBER OF CLAIMS: 152 11 Figure(s).

DESCRIPTION OF FIGURES:

FIG. 1 shows the assay (using a quantitative RT-PCR method known to those practiced in the art) of the ataxin1 mRNA obtained from HEK293H cells that have been transfected with plasmid containing an anti-ataxin1 ribozyme (top lanes in FIG. 1) or with siRNA against ataxin1 (bottom lanes of FIG. 1).
 FIG. 2 shows the assay (using the same quantitative RT-PCR method known to those practiced in the art) of the ataxin-1 mRNA obtained from HEK293H cells that have been transfected with anti-ataxin-1 small interfering RNA (bottom lanes) compared to the mRNA obtained from HEK293H cells that have been transfected with a control siRNA that targets the mRNA for glyceraldehyde-3-phosphate dehydrogenase (GAPDH)
 FIG. 3 shows the construction of the adeno-associated virus expression vector

pAAV-siRNA.

FIG. 4 illustrates an investigational device (by Medtronic, Inc. of Minneapolis, Minn. Model 8506), which can be implanted subcutaneously on the

cranium, and provides an access port through which therapeutic agents may be

delivered to the brain.

FIG. 5 illustrates an investigational device (by Medtronic, Inc. of Minneapolis, Minn. schematic of Model 8506), which can be implanted subcutaneously on the cranium, and provides an access port through which therapeutic agents may be delivered to the brain.

FIG. 6 illustrates the relation of various neurodegenerative diseases described

herein, and the location of treatment with small interfering RNA vectors directed to their intended targeted gene product.

FIG. 7 contains three views of brain tissue section number 67 from a consecutive series of parasagittal brain tissue sections from the left hemisphere of mouse number three from administration of an AAV vector encoding

for green fluorescent protein to a C57Bl/6 mouse.

FIG. 8 contains photographs of multiple brain tissue sections throughout the

left hemisphere of this mouse number 3, from section 29 (lateral) to section

125 (near the midline of the animal, in the sagittal plane) from administration

of the AAV vector encoding for green fluorescent protein.

FIG. 9 is a comparison of treated and control Tg2576 mice receiving contextual

fear conditioning at 15 months of age after those mice had been

neurosurgically

treated at 12 months of age with an AAV vector encoding for anti-BACE1 siRNA or

an AAV vector encoding for a control siRNA expected to be inactive with respect

to suppressing BACE1 mRNA.

FIG. 10 illustrates immunostaining for BACE1 protein in normal mouse hippocampus.

FIGS. 11A, 11B, and 11C is a sequence alignment of our sheep huntington gene

sequence with the human Huntington gene sequence available in Genbank (NM

002111.3).
